BrightTV Viewership Analysis

Understanding User Behavior & Improving Engagement

Siphamandla Moyo

Overview

This presentation analyses BrightTV viewership data to understand user behaviour and identify opportunities to improve engagement.

The main goal of this analysis is to understand how users interact with the platform.

Project Objective

- Analyse user viewing behaviour
- Identify trends and patterns
- Understand low engagement periods
- Provide recommendations to increase usage

Platform Overview

The platform recorded over 9,000 viewing sessions from more than 4,000 users, with a total of over 91,000 minutes watched. This indicates strong overall engagement.

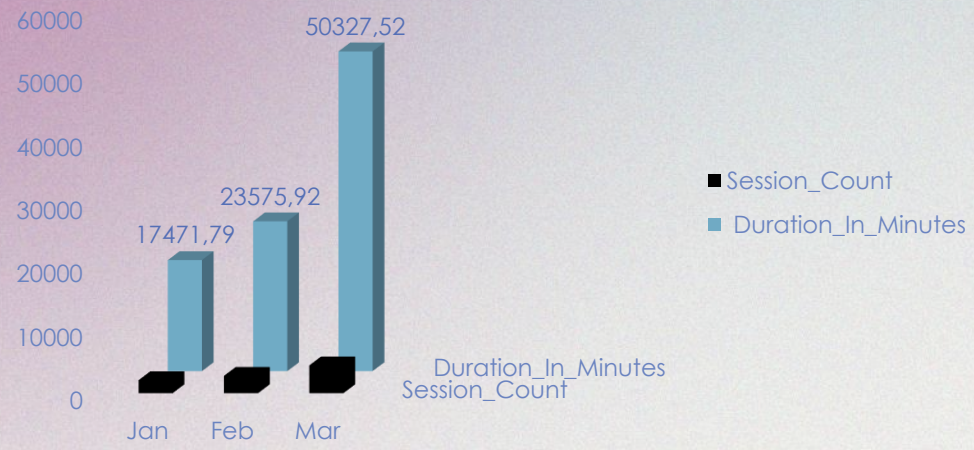
Total sessions
9145

Unique Viewers
4,119

Total Minutes Viewed
91284.81

Avg. Session Duration
9.99

Viewing Trends Over Time

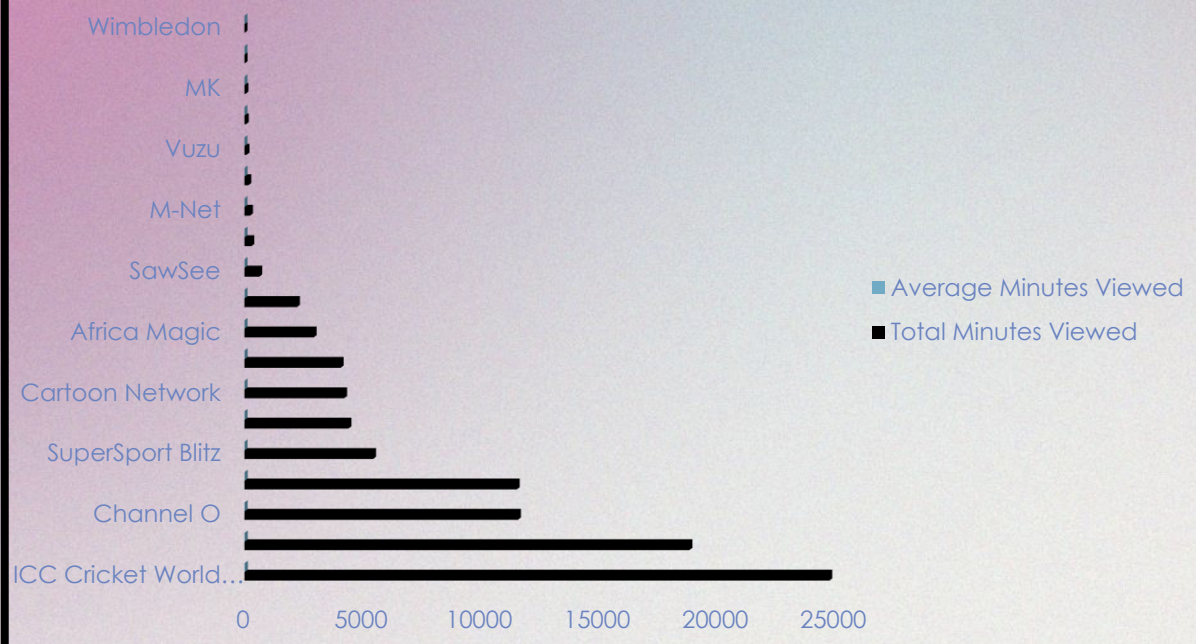


Viewing activity shows a steady increase from January to March, indicating growing user engagement over time.

April data was excluded from the analysis as it represents an incomplete period and would distort the trend.

Channel Performance

What content is driving engagement on BrightTV?

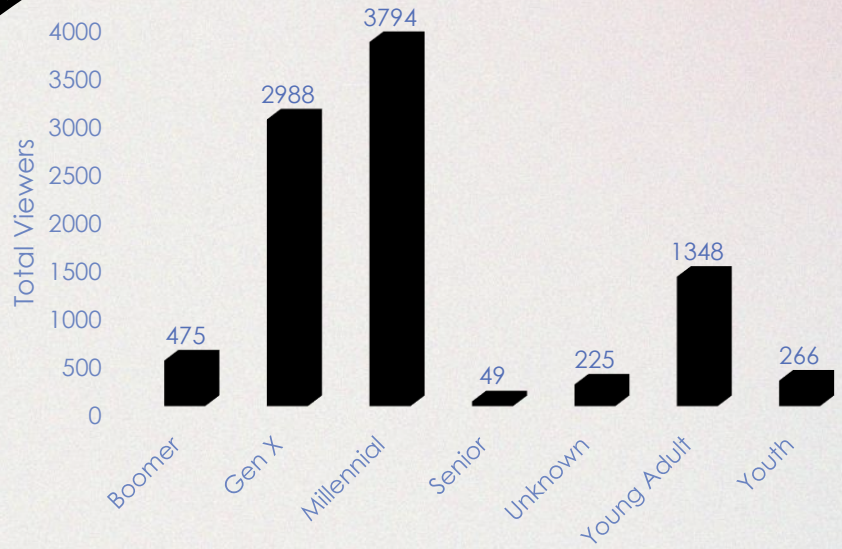


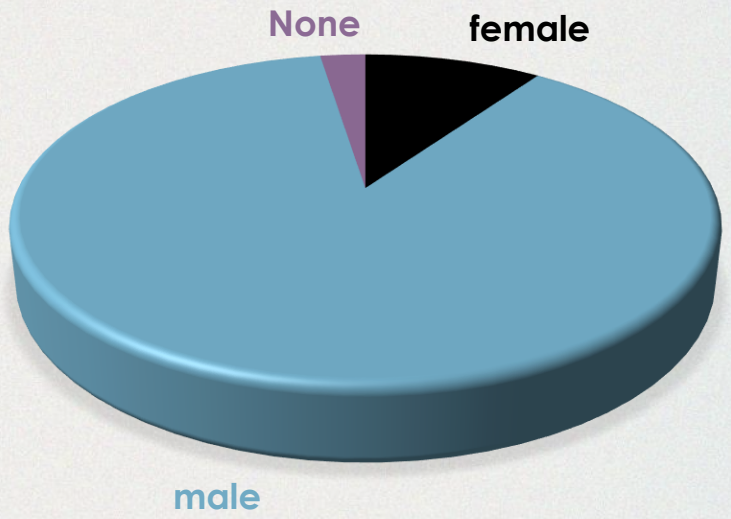
A small number of channels contribute most of the total viewing time, with sports-related content such as CC Cricket World Cup 2 and SuperSport Live Events driving the highest engagement on the platform.

This indicates that users show a strong preference for live sports content, making it a key driver of platform usage.

Audience Demographics

Audience is Concentrated in Key Age Groups





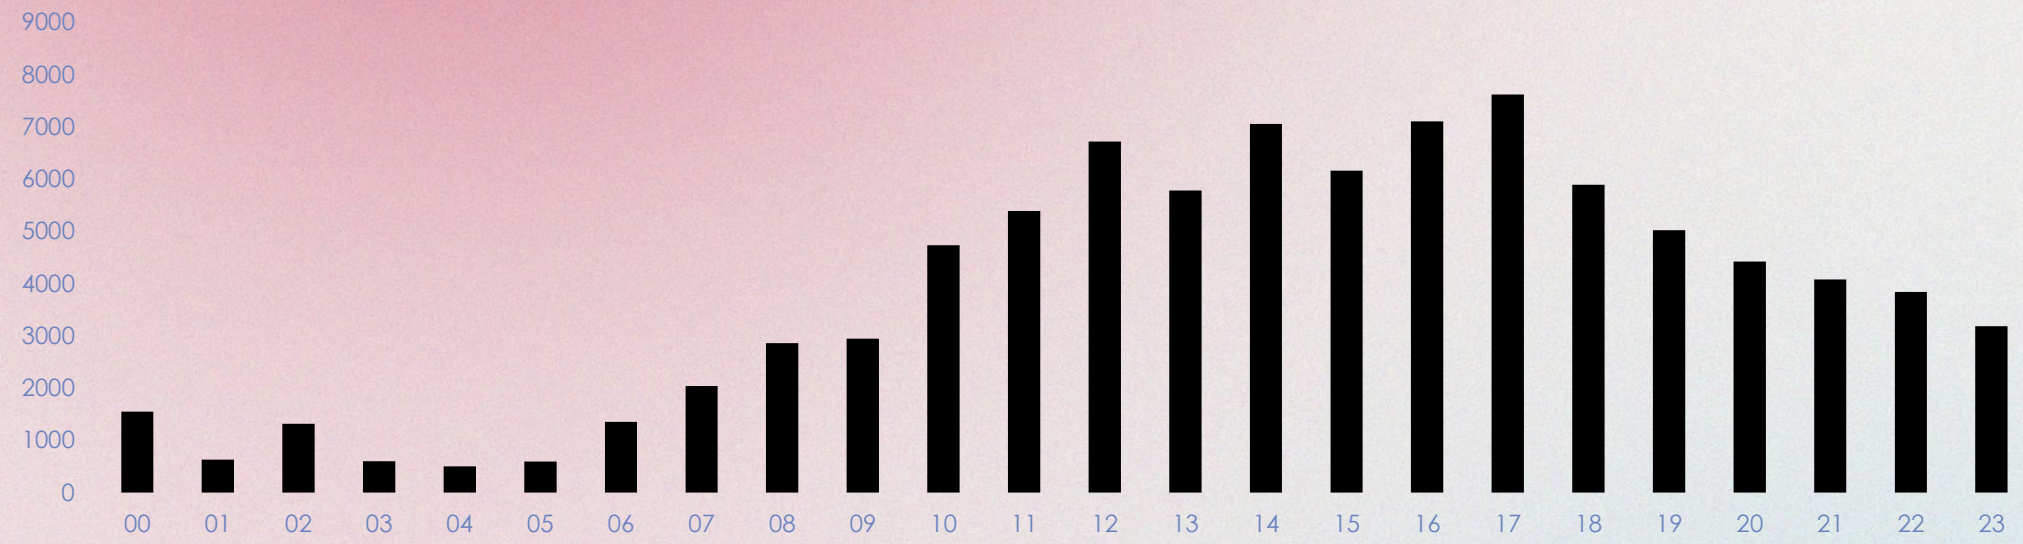
The platform's audience is primarily concentrated in the Gen X and Millennial age groups, indicating that most users fall within the 25 to 49 age range.

This suggests that BrightTV's content is most appealing to working-age adults who are likely consuming content during their free time.

The dataset shows a higher number of male users; however, this may reflect data limitations rather than actual audience distribution.

Peak Viewing Hours

When are users most active on the platform?



Viewing activity increases throughout the day and peaks in the late afternoon and early evening, showing that users are most active after work or school hours.

The highest concentration of viewing happens between 14:00 and 18:00, making this the best time to bring out high-priority content.

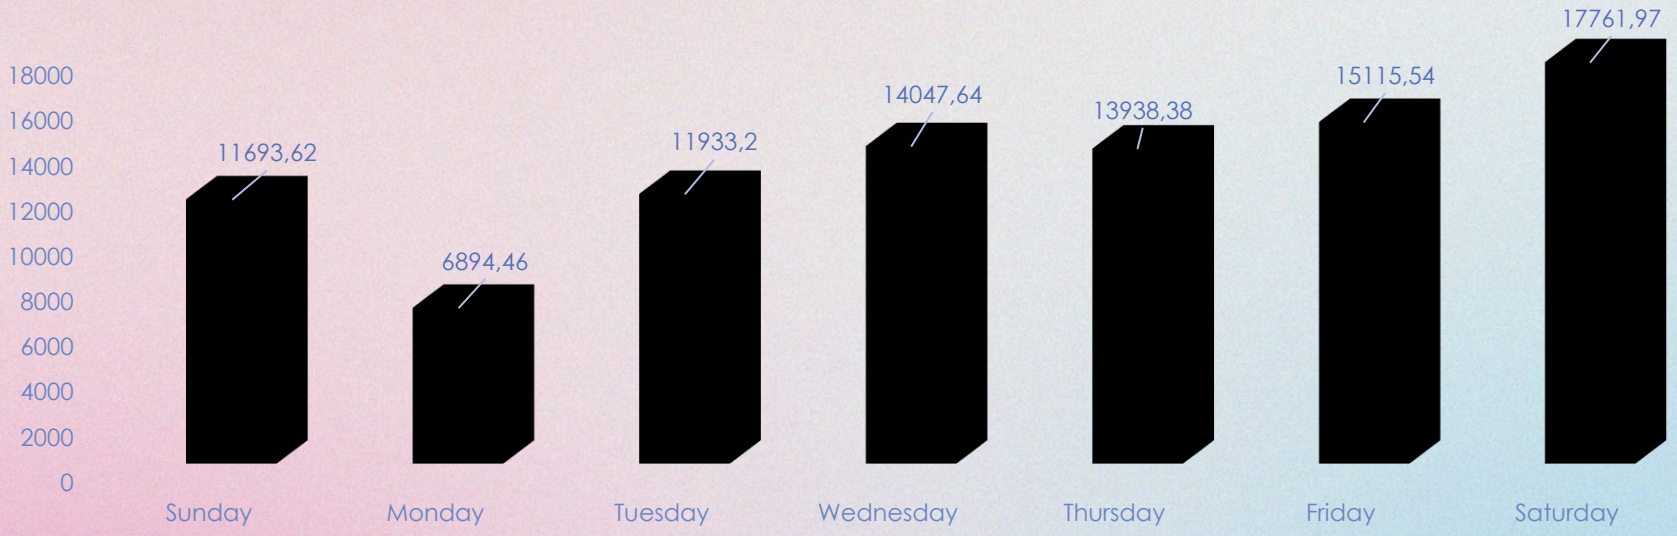
Day of Week Analysis

Which days have the highest and lowest engagement?

While total viewing appears higher during weekdays, adjusting for the number of days shows that average viewing per day is higher on weekends.

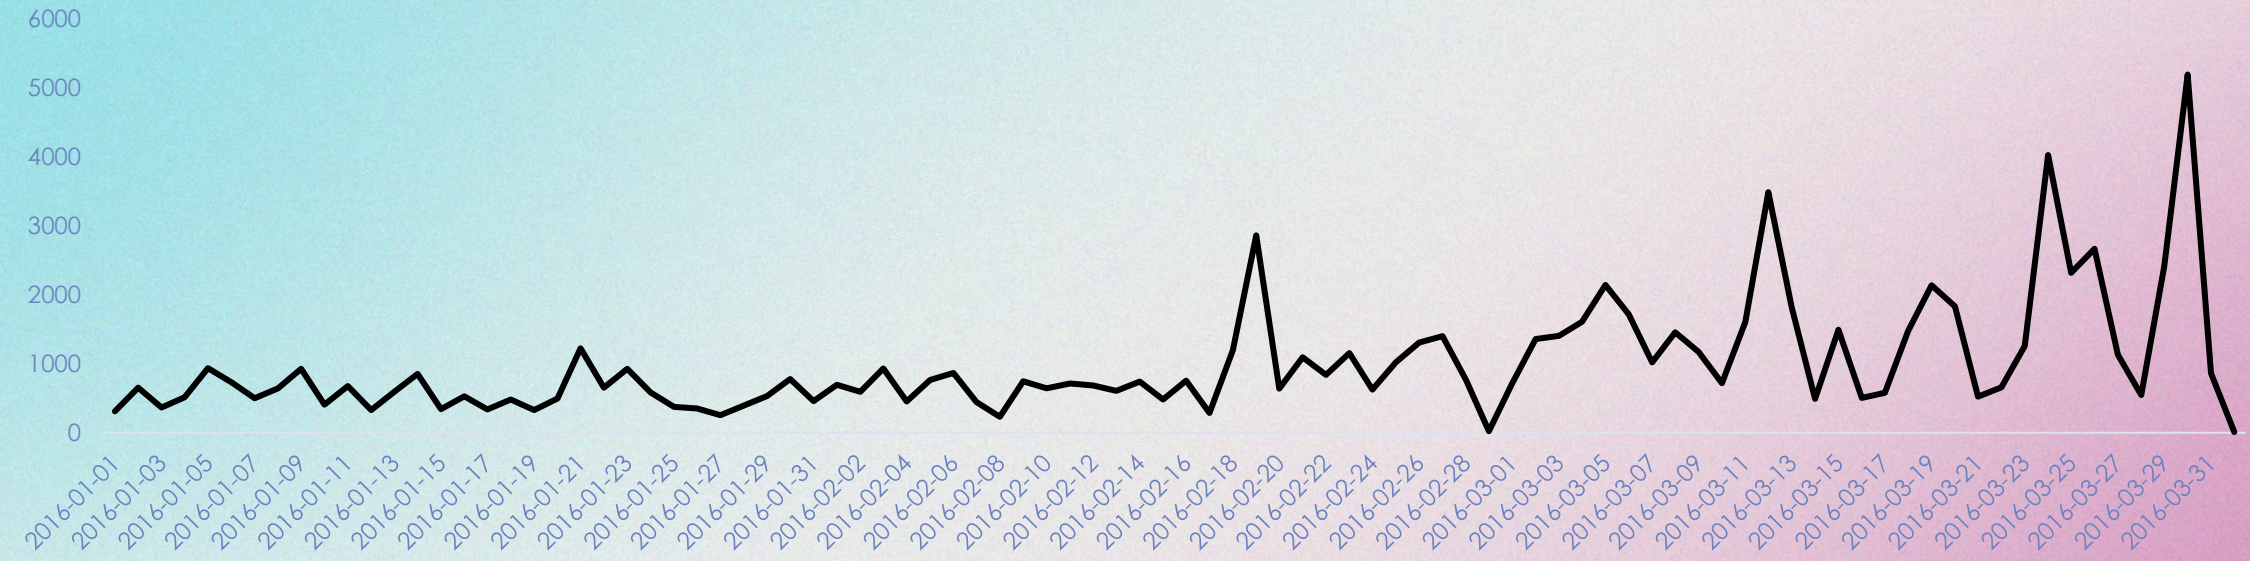
Viewing is highest on Saturdays and lowest on Mondays, highlighting clear differences in user behaviour across the week.

Weekend Viewing is Higher on a Per-Day Basis



Low Engagement Days

Significant Fluctuations in Daily Engagement



Viewing activity fluctuates significantly over time, with certain days showing extremely low engagement compared to peak periods .

Some days record less than 300 minutes of viewing, while peak days go over 5,000 minutes, highlighting a major inconsistency in user engagement

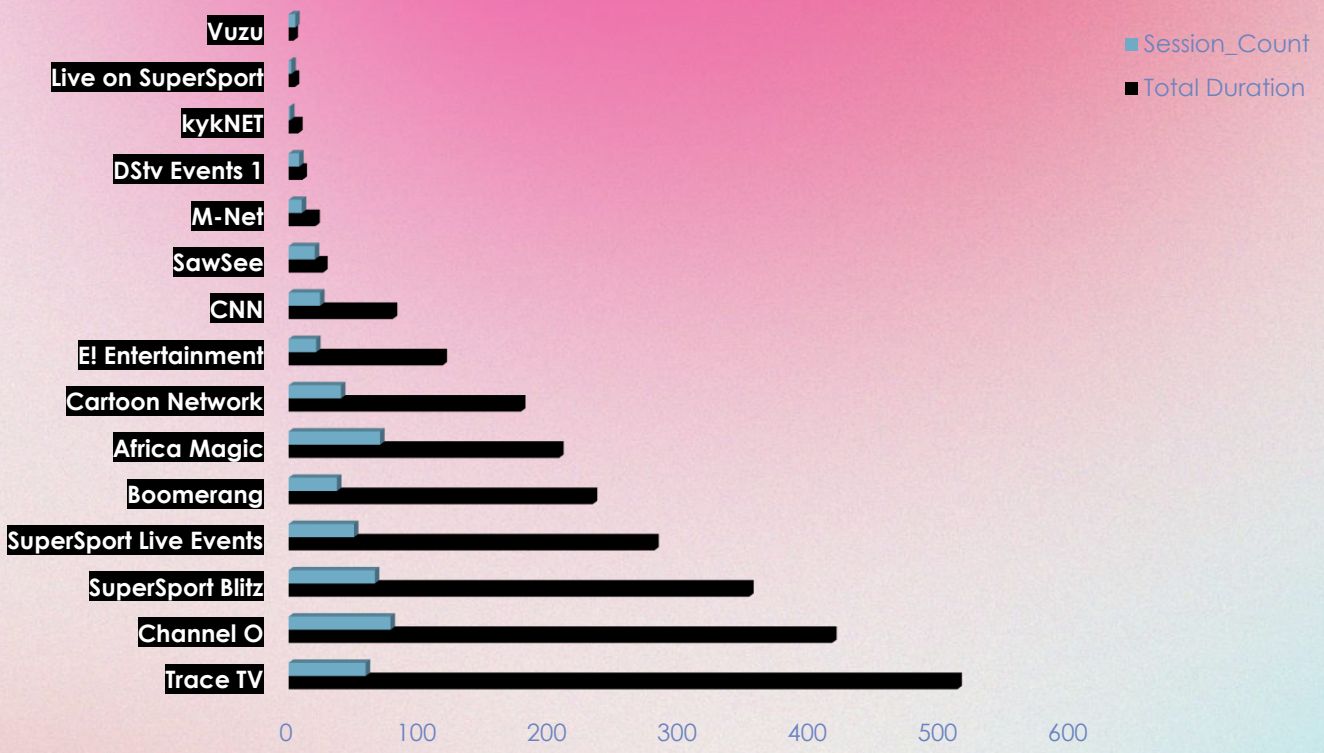
Low days ≈ 200–300 mins

High days ≈ 2000–5000 mins

To address this issue, I analysed which channels still perform during these low-engagement periods.

Channel Performance on Low Engagement Days

High-Performing Content Remains Strong on Low Engagement Days



Top performing channels: Trace TV → 512 mins 🔥

Channel O → 416 mins

SuperSport Blitz → 352 mins

SuperSport Live Events → 280 mins

Even during low engagement periods, certain channels such as Trace TV, Channel O, and SuperSport content continue to attract viewers, showing that specific types of content remain consistently appealing.

Promoting high-performing channels during low-engagement periods can help increase overall platform usage and reduce fluctuations in viewing activity.

Recommendations

- Promote channels such as sports and music content during low-engagement periods to increase overall platform usage.
- Release new and premium content during peak viewing hours (afternoon to evening) to maximize reach and engagement.
- Introduce special content or promotions on weekends to take advantage of higher per-day user engagement.
- Target content and marketing efforts towards Gen X and Millennial users, who form much of the audience.
- Implement targeted campaigns on low-performing days to maintain consistent user activity across the platform.

By aligning content strategy with user behaviour and viewing patterns, BrightTV can improve engagement, reduce low-activity periods, and maximize overall platform performance.

Summary

- The platform shows strong overall engagement, with over 9,000 sessions and more than 91,000 minutes of content consumed.
- Viewing activity increased steadily from January to March, indicating growing user engagement over time.
- A small number of channels, particularly sports and music content, contribute most of the total viewing time.
- Viewing activity peaks during the afternoon and evening hours, making this the most important period for content delivery.
- While total viewing is higher during weekdays, average viewing per day is higher on weekends, indicating a stronger engagement when users have more free time.
- Some channels continue to perform well even on low-engagement days, providing an opportunity to improve overall platform usage.

Thank you
